---

Dear Hiring Manager,

I am a Staff Engineer with 7.5 years building the infrastructure layer that sits underneath product features — the event pipelines, storage engines, and distributed systems that either hold or break under real-world load. I am writing to express my interest in a Staff Engineer role on your infrastructure team.

My work reflects experience in high-cardinality distributed systems at scale:

- . **Wayfair:** Led two engineering teams to ship a GCP event-driven pricing engine that reduced price propagation latency from hours to sub-seconds across 250k+ SKU updates per supplier.
- . **Agoda:** Contributed to WhiteFalcon, an in-house TSDB in Rust + Scala ingesting **1.5 trillion events per day**; extended the query engine to solve the quantile merge problem and hardened the RoaringBitmap index.
- . **Delivery Hero:** Built end-to-end rider tracking processing 5k map adjustments per second using OSRM on AWS EKS.
- . **Walmart Labs (3 years):** Architected the WeloT SmartBuildings platform handling 7M+ sensors and tens of millions of telemetry points per minute on Azure IoT Hub.
- . **Current Project:** Building **infra-ai-streaming**, an open-source AI inference observability platform in Rust—a high-throughput ingestion pipeline (Axum → Kafka → ClickHouse → Grafana) designed to handle the metric volume and cardinality of LLM inference.

I am drawn to teams where infrastructure is a first-class engineering problem — where the interesting work is in the storage layer, the pipeline internals, or the reliability primitives, not just the application layer sitting on top. If that describes your team, I would welcome the conversation.

Thank you for your time and consideration.

Warm regards,

**Akshant Sharma**
